New seal allows aerator to operate in harsh environments

A new custom engineered motor seal has been added to all HURRICANE[®] submersible aspirating aerators. The seal eliminates the exposed spring and seal faces common on other mechanical seals providing exceptional protection in harsh environments where stringy material, grit and other contaminants are present. This new seal allows HURRICANE[®] aerators to operate in the harshest wastewater environments such as digesters, aerated grit chambers, aeration basins, wet wells, and unscreened equalization basins. This seal is now standard on all HURRICANE[®] aerators.

AEROMIX is a world leader in the design, development, manufacturing, application, support and service of aeration equipment, mixing products, packaged wastewater treatment systems, and packaged water treatment systems. The company has over 2500 installations in 74 countries.
